Abstract

The invention is a cigarette casing, which is intended for independent making of a «Russian» cigarette (papirosy) by a smoker or for bulk production.

10 The casing of the «Russian» cigarette has an empty mouthpiece (1) and a connected empty envelope (2) at least a part of the cavity (4) of which is intended for the allocation of the smoking material. It contains a separating partition being selectively penetrable for the smoke, installed so that at least a part of the cavity (3) of the mouthpiece (1) could be detached from at least a part of the cavity (4) of the envelope (2) and so that it is possible to overlap at least a part of the cross section of
15 the cavity (3) of the mouthpiece (1).

Its design impedes, making minor changes in the composition of the smoke, the penetration of the particles of the smoking material located in the cavity (4) of the envelope (2) into the cavity (3) of the mouthpiece (1) while filling the casing with this smoking material and into the mouth of the smoker during smoking.

20 The casing of the «Russian» cigarette has an empty mouthpiece (1) and a connected empty envelope (2), the length of the mouthpiece (1) not less than the length of the envelope (2), the envelope (2) overlaps the mouthpiece (1) with all its length, the mouthpiece (1) and the envelope (2) are installed so that it is possible to move them relative to each other along the common longitudinal axis. The
25 mouthpiece (1) impedes the deformation of the part of the cavity (4) of the envelope (2) intended for the allocation of the smoking material before the placing of this smoking material.
